This represents a human secreted protein. The specification provides secreted protein sequences (AAW63681 to AAW63699) encoded by the nucleic acid sequences shown in AAV43601 to AAV43619. The invention provides a method of identifying a secreted polypeptide which is modified by rough microsomes. The secreted proteins can be used in assays to determine biological activities, such as cytokine, cell proliferation, or cellular differentiation activities, tissue growth or regeneration, activin or inhibin activity, chemotactic or chemokinetic activity, haemostatic or thrombolytic activity, receptor/ligand activity, tumour inhibition, or anti-inflammatory activity. The proteins can also be used as biomarkers, to identify tissues or cell types which express the proteins, or a stage-
                                                                                                                                                                                                        Claim 1; Page 53;
                                                                                                                                                                                                                                                        differentiation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homo

In addition, the disclosed sequences may be useful for gene therapy. The polypeptides or their antibodies are useful for treating many diseases such as arthritis, Parkinson's, Alzhaimer's, autoimmune diseases, cance psoriasis, inflammatory bowel disease and infections caused by bacteria viruses, fungi or parasites. The present sequence is that of a human polypeptide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      or disease-specific alteration in protein expression. They can be used in protein interaction assays, to identify ligands or binding proteins. Compounds which affect the biological activities of the secreted proteins or their ability to interact with specific ligands can be identified using the proteins in screening assays. The proteins and antibodies that bind specifically to the protein can also be used to design diagnostic tests and therapeutic compositions for diseases which may be associated with altered expression of these proteins. Fusion proteins comprising, e.g. signal sequences or transmembrane domains of the proteins can be used to target other protein domains to cellular membrane or they can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; secretory differentiation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                   This is the amino acid sequence of a clone of a human secretory signal protein sequence, used in the method of the invention. All of the proteins sexist in the cell membrane, so are considered to be proteins controlling the proliferation and differentiation of the cells. They may be useful as carcinostatic agents or as antigens for preparing antibodies against the proteins. The cDNAs can be used as probes for gene diagnosis and gene sources for gene therapy, as well as for large-scale expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             15-APR-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is the amino acid sequence of a clone of a human secretory signal protein sequence, used in the method of the invention. All of the proteins exist in the cell membrane, so are considered to be proteins controlling the proliferation and differentiation of the cells. They may be useful as carcinostatic agents or as antigens for preparing antibodies against the proteins. The cDNAs can be used as probes for gene diagnosis and gene sources for gene therapy, as well as for large-scale expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  26-AUG-1999

screen Novel nucleic acids encoding PRO polypeptides, used to diagnose the nce of tumors, such as prostate and breast tumors, in mammals and for modulators of the compounds. breast tumors, in mammals and

ç

Claim 11; Fig 342; 774pp; English.

Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention. The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the anima and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats the animal

> and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders Sequence 220 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Run on:
             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score

Pseudomon Lung canc

The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an FC domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(L2)d-P2, -(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently linkers; and a, b, peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b,

Claim 39; Page 299; 608pp; English.

active Novel

composition of matter comprising an Fc peptides, useful for treating cancer a

c domain and pharmacologically and autoimmune diseases.

The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain, oran provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the

This invention relates to novel mammalian CDR mimetibodies, specific portions or variants thereof. Specifically, it refers to an antibody fragment where a protein has been inserted into, or replaces a portion of, one or more CDR regions, such that each CDR mimetibody comprises at least one portion of a heavy chain or light chain variable region, which

cc prophylactic agent as well as for screening purposes. (I) is useful for cc diagnosing diseases characterised by dysfunction of their associated protein of interest, for identifying normal or abnormal proteins of interest in a biological sample. Additionally, (I) is useful cc proteins of interest in a biological sample. Additionally, (I) is useful cc for treating inflammatory and autoimmune diseases, tumour growth, cancer, cc remunatoid arthritis, diabetic retinopathy, obseity, sleep disorders, cc infertility, and neurological degenerative diseases. (I), comprising EPO-cc mimetic compounds are useful for treating disorders characterised by low cred blood cell levels such as anaemia. The TPO-mimetic comprising cc compounds are useful for treating conditions that involve an existing megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet cumour which result in thrombocytopaenia, spastic anaemia, metastatic cumour which result in thrombocytopaenia, spastic anaemia, metastatic cumour which result in thrombocytopaenia, spastic anaemia, metastatic cumour which result in thrombocytopaenia, spastemic lupus erythematosus, cr represent amino acid and nucleic acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             itself comprises at least one human framework region and at least one ligand binding region (LBR). The present invention describes human mimetibodies, including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms of immune, cardiovascular, infectious, malignant and/or neurologic diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, cardiant, antimicrobial, cytostatic and neuroprotective activities. This peptide sequence is an SH3 antagonist peptide sequence used to make a mimetibody of the invention.
cardiovascular, cardiant, hypotensive, neuroprotective, nootropic, antibacterial, virucide or fungicide activity. In addition, the discloss sequences may prove useful for gene therapy. The CHI-deleted mimetibody is useful for diagnosing or treating a disease condition in a cell,
                                                                                                          This invention relates to CH1 deleted mimetibodies (and the DNA se which encode them), compositions, methods and uses. The invention useful for the development of compounds with an immunosuppressive,
                                                                                                                                                                                                                                                                                                          New CH1-deleted mimetibody polypeptides and nucleic acids, useful for modulating, treating, alleviating, preventing an immune, cardiovascular, or neurodegenerative disease or disorder, anemia, cancer, or infectious
                                                                                                                                                                                                                                Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                WPI;

                     AAW11098-W11124 are peptides that bind to the Src SH3 domain. The SH3 binding peptides are useful in modulating signal transduction pathways the cellular level (especially protein tyrosine kinase-mediated), modulating oncogenic protein activity, or providing compounds for the development of drugs with the ability to modulate broad classes, as well as specific classes, of proteins involved in signal transduction and all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 7
                                                                                                                                                                                                                                                                                                                               Peptide with binding affinity for Src homology region 3 proteins - useful for e.g. modulating signal transductic cellular level, esp. protein tyrosine kinase-mediated.

                                AAW16924-W16948 are random recombinant peptides derived from one of three peptide libraries, T9, T12 and R8C. The peptides are all SH3 domain-binding peptides. SH3 binding peptides are useful in modulating signal transduction pathways at the cellular level (especially protein tyrosine kinase-mediated), modulating oncogenic protein activity, or providing compounds for the development of drugs with the ability to modulate broad classes, as well as specific classes, of proteins involved in signal transduction and also for regulating the processing, trafficking or translation of RNA. Conjugates of the peptides with detectable labels or imaging agents are useful for imaging cells, tissues and organs in which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Conjugates of the peptides with detectable labels or imaging useful for imaging cells, tissues and organs in which Src or

                                                                The present sequence represents a random peptide recombinant isolated by CC the method of the present invention. SH3 (Src homology region 3) binding CC peptides are selected from: (a) peptides which bind the SH3 domain of CC Cortactin; (b) peptides which bind the middle SH3 domain of Nck; (c) peptides which bind the SH3 domain of Nck; (c) CC SH3 domain of Src; (e) peptides which bind the SH3 domain of PLC gamma; CC (f) peptides which bind the SH3 domain of PLC gamma; CC (f) peptides which bind the SH3 domain of CC (f) peptides which bind the SH3 domain of Yes; and (i) peptides which bind the amino-terminal SH3 domain of Grb2. The purified binding peptides can be used in the method to (c) dontify inhibitors of their binding to their respective SH3 domains, CC which could be used to modulate the pharmacological activity of proteins CC or polypeptide containing the SH3 domain. The peptides can also be used to activate Src or Src-related protein tyrosine kinases, to stimulate the containing the SH3 domain of certain lymphokines, e.g. CC conjugated molecule to certain cellular compartments containing Src or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              문

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                           AAH32522-AAH32627 represent cDNAs corresponding to 35 human secreted protein genes, and AAG73346-AAG73448 represent the proteins they encode. AAG73449-AAG73519 represent human secreted protein fragments. The genes and their corresponding secreted proteins are useful for preventing, corresponding or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions conditions, e.g., by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 52 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, neurological disorders (e.g., Alzheimer's disease, eathma, skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, cartification disorders, angiogenic disorders, kidney disorders.
                          gastrointestinal disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due sunburn, to maintain organs before transplantation, for supporting ceculture of primary tissues, to regenerate tissues, to identify their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ...
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            foetal abnormality; developmental abnormality; haematopoietic disorder; immune system disorder; ALDS; autoimmune disease; rheumatoid arthritis; inflammation; allergy; neurological disorder; Alzheimer's disease; parkinson's disease; cognitive disorder; schizophrenia; asthma; skin disorder; psoriasis; sepsis; diabetes; atherosclerosis; cardiovascular disorder; anglogenic disorder; kidney disorder; gastrointestinal disorder; pregnancy-related disorder; tumour; endocrine disorder; infection; wound healing; vulnerary; cell culture; chemotaxis; food additive; binding partner identification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             as a food additive or preservative to modify storage properties.
Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                   The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosting disorders such as cancer, reproductive disorders, digestive disorders (e.g. Crohn's disease, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocraine disorders (e.g. diabetes), haematopoietic disorders, neural disorders (e.g. Alzheimer's,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Albumin fusion protein; therapeutic protein; human albumin; thousan serum albumin; HSA; cancer; reproductive disorder; disorder; immune disorder; endocrine disorder; haematopoietic disorder; neural disorder; connective disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S
contribution protein comprising the albumin fusion protein can a pharmaceutical carrier; a kit comprising the composition of the albumin fusion protein formula; a method of treating a disease or disorder in a patient comprising the step of administering the albumin comprising a patient with a disease or disorder that is modulated by Therapeutic protein; x, or its fragment or variant; a mucleic acid molecule comprising a polynucleotide fragment or variant; a nucleic acid molecule comprising a polynucleotide comprising the albumin fusion protein; and a host cell comprising the nucleic acid molecule of the albumin fusion protein, and a host cell comprising the nucleic acid molecule of the albumin fusion protein. The albumin fusion protein, and a host cell comprising the protein and its compositions have the following cativities: cytostatic, antianemic, antiarthritic, antiarabetic, antiara
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

The albumin fusion protein nucleic acid may CC be used in gene therapy to treat disorders. The albumin fusion protein nucleic acid may CC be useful for diagnosing, treating, preventing or ameliorating diseases or CC disorders comprising indication: Y. The diseases or disorders include: CC cancer (e.g. leukaemia, colon, bone, breast, liver or lung cancer), CC immune or haematopoistic diseases (e.g. anaemia, Hodgkin's disease, acute CC lymphocytic anaemia, multiple myeloma, arthritis, asthma, AIDS, autoimmune disease, inflammatory bowel disease, psoriasis or Lyme CC disease), reproductive system disorders (e.g. prostatitis, inguinal CC hernia, varioccele, penile carcinoma, ovarian adenocarcinoma or Sertoli-Leydig tumours), musculoskeletal diseases (e.g. prostatitis, inguinal CC paget's disease, systemic lupus erythematosus, gout, muscular dystrophy CC or cachexia), cardiovascular disease (e.g. rhabdomyomas, heart disease, CC arrhythmia, cardiac arrest, heat valve disease, hypernatraemia or CC hyponatraemia) mixed foetal diseases (e.g. foetal alcohol syndrome, CC sachs disease), excretory diseases (e.g. foetal alcohol syndrome or Tay Sachs disease), excretory diseases (e.g. toetal alcohol syndrome, CC carpbellar ataxia, attention deficit disease; autism or obsessive compulsive disease, parkinson's disease (e.g. emphysema, lung cancer or CC disease or glomerulonephritis), digestive diseases (e.g. portal cC disease or glomerulonephritis), digestive diseases (e.g. portal cC disease or glomerulonephritis), digestive diseases (e.g. portal cC or connective tissue or epithelial diseases (e.g. Crohn's disease, addison's clearoderma, wound healing or epidermolysis bullosa). This sequence CC represents a therapeutic protein x relating to the albumin fusion protein CC disease for conditions or sensory website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The expression cassettes, set of nucleic acids, (set of) vectors, or methods are useful for producing a library of lantibiotic-producing host cells or a library of lantibiotics. These are particularly useful for producing lantibiotic cinnamycin or its modified versions. The lantibiotics are useful as antibiotics having efficacy and utility as food additives and antibacterial agents against propionibacterium acnes and problematic pathogens, e.g. methicillin-resistant Staphylococcus aureus (which has or is developing resistance to many commonly used antibiotics), or Streptococcus pneumoniae. Sequences ABP71191-71211 represent the various cinorf proteins encoded by the cinnamycin cluster from S. Crinamynenia 40005 as present on the plasmid number.

CC encoding a Propionibacterium acres protein. The invention also relates to golypeptides encoded by the polymucleotides (ARM35624-ABM6435) and to compose the invention also relates to compose the invention of polypeptides. The invention additionally encompasses expression vectors and host cells comprising a golypeptide of the invention comprising a polypeptide of the invention; antibodies against polypeptides of the invention; antibodies against polypeptides of the invention; a comprising a polypeptide of the invention; a comprising a polypeptide of the invention; a composition (comprising T cells prepared comprising T cells prepared the comprising T cells prepared to T cells prepared
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
